

User guide

29a Inc.
Form with PHP scripting

<https://www.29a.ca/>

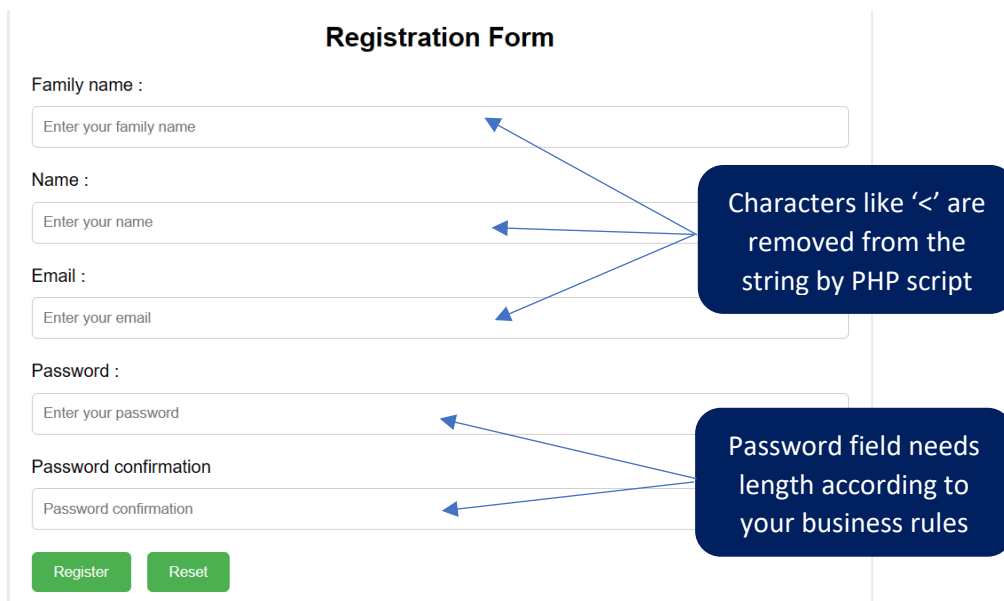

Register Form script

The register form contains:

- The script to create client table (MySQL 5.7.31) ;
- The HTML pages and the php scripts (PHP 7.3.2.1) ;
- CSS ;

The register form allows a user to register in the system. The user enters the family name, the name, the email, the password, and the password confirmation. The password and the confirmation password must be identical to be successful. The password is hashed with SHA512 and stored in the database.

The register form cleans the fields from injection by removing special characters.

Registration Form

Family name :

Name :

Email :

Password :

Password confirmation

Annotations:

- Characters like '<' are removed from the string by PHP script (points to Name, Email, and Password fields)
- Password field needs length according to your business rules (points to Password and Password confirmation fields)

If the passwords are not identical, the system informs the user by a red message.

Password :

Password confirmation

The passwords must be identical...

The password and the confirmation password must be identical

When the registration is successful, the system navigates to a landing page. The programmer must adapt the behavior according to the needs. The routing can be changed in the *routing.php* file.

Landing page

If the database is down or there is an error in SQL AFTER modification by the programmer then the system manage the error.

An error has occurred...

Specials notes:

*** The programmer must create the database *users*. If the programmer uses another database, it must be changed in DataBaseConnectionManager.php file. ***
